PROFILE

I design B2B platforms (fintech, HR), e-commerce sites and mobile apps, from user research, user flows and prototypes to UI and visual design, design systems and developer handoff. My largest research: a survey of 63 people and a prototype test on TON Walk, a prototype test with 8 civil servants for an HR platform, and a usability test with 22 people for a real estate agency

WORK EXPERIENCE

Product designer, Mish (design studio) · August 2025 - present · full-time, remote

- A full redesign of a public-sector HR platform for civil servants (client under NDA), two versions with about 2,000 and then about 800 screens for desktop, tablet and phone: the news feed, the workplace, profiles, the staff directory, learning and the knowledge base. The old platform was hard to use and had no mobile version. In development, release in November 2026
- Sign-in, recovery and registration for web and phone, 37 states each, plus 9 error pages; a review of the studio's build of the news feed with about 50 notes, from spacing to broken navigation
- Its design system, built with a second designer, is part of the redesign: 604 variables and 116 component sets; developers already build screens with it
- Claude in Figma builds screens from the requirements and our design system, I review each one: a flow rework took a couple of hours instead of over a day
- Research on my own and with the team: an audit of the old platform, similar products, interviews, the client's research data and support requests, CJM and JTBD. I ran a test of the clickable prototype with 8 civil servants on 9 tasks and ranked the findings by severity and frequency; the most common one, unclear section names, came up with all 8
- Concepts (clients under NDA): a dating service built around events, with a review of similar apps and three review rounds with the client, and since October 2026 a new B2C product, from stakeholder interviews to prototype tests

Product designer, freelance · March 2025 - June 2026 · project work alongside my main job

- UXdevice and Miningx100 (see Selected projects). For UXdevice: client interviews, analytics from the client's documents, usability and A/B tests with the client's customers and partners

Product designer, O.dev (Oshka), studio · January 2025 - July 2025 · contract

- TON Walk, a walk-to-earn game inside Telegram: the only product designer, from a survey of 63 people to the design system and handoff, working with the product owner, product managers, QA and developers
- An internal B2B finance platform, four months, working under a lead designer. I designed the home page with finance widgets (balances in several currencies, currency turnover, exchange rate differences) and the deals section, with list and Gantt views and a 13-column table with filters, bulk actions and export, and two sign-in flows. I extended the platform's existing design system. Launched

Product designer, SidePay and CoinUp (products of one employer) · May 2024 - January 2025 · contract

- CoinUp, October 2024 - January 2025, the only product designer. An iGaming mobile app with mini games, duels and real-money bets. For its second version I ran an MVP audit, which showed that games were hard to find, and tests with more than 300 of the client's customers and friends, which showed demand for new mini games and a new home screen. I added search and sections to the home screen and reworked the structure, the entry through a Telegram bot, the onboarding and the duel cards
- SidePay, May 2024 - October 2024, alongside my full-time job at Raduga Light. A B2B payments platform: I interviewed 20-25 managers and staff, mapped the roles and flows, made a customer journey map in Miro and tested prototypes with future clients; the drag and drop they found hard moved up to the heading level. I built the UI kit and led a second designer; the team worked in English

UX/UI designer, Raduga Light (a maker of lighting equipment) · January 2024 - September 2024 · full-time

- A B2B catalog with two configurators, a request cart and an organisation account, more than ten websites and landing pages; A/B tests in Yandex Metrica, surveys in Telegram; I extended the company's design systems

UX/UI designer, Mirkvartir, real estate agency (contract) · May 2023 - January 2024

- A redesign of the whole website: an online usability test with 22 of the agency's clients and staff gave a list of small fixes across the site, such as the property cards; the search, a UI kit

UX/UI designer, freelance · January 2022 - 2023

- UX concepts, interviews, usability tests, prototypes and handoff for different clients

---

SELECTED PROJECTS

Design system for a public-sector HR platform · 2025-2026

One of two designers

- An audit of 24 components of a ready-made library, after which the client chose to build its own system. The header with navigation and most of the basic components are mine. Developers get the variables as a file exported from Figma and keep their own component library in code, built to match the system

UXdevice, a marketplace for robots · 2026, three months

The only designer, freelance

- 16 pages in four screen sizes and all graphics; a design system with three levels of tokens: 188 primitive, 229 semantic and 414 component tokens; a review of the studio's build in three rounds: 25 issues, then 8, then 3. In the catalog I argued for one list with a "Show more" button over pagination; the client agreed. Launched

TON Walk, a walk-to-earn game inside Telegram · 2025, three months

The only product designer

- A survey of 63 people: 62% did not understand how earning works. Earnings became TON per kilometre, and the walk screen leads with the TON earned. In the prototype test in three groups, 87% understood how to earn and about nine in ten completed the task. 94 screens within Telegram's limits, 46 component sets. MVP released

Miningx100, an online store for mining hardware · March 2025 - 2026

The only designer, private client

- A 7-stage customer journey map named a long order form and unclear payback among the pains; on the site, a request takes two fields and the calculator shows payback per model. More than 60 screens; six landing pages; a mining profit calculator from desktop to phone; a design system. Launched

This portfolio site: my Figma design, built with Claude Code · 2026

- A static Python site, a local admin panel, WebGL glass from my Figma shaders; I reviewed every change

---

SKILLS

Design: product design, UX/UI design, UI and visual design, interaction design, user flows, information architecture, wireframes, prototyping, responsive web, mobile apps (Apple HIG, Material Design), Telegram Mini App

Design systems: components and variants, tokens as Figma variables, light and dark themes, UI kits

Research: user research: interviews, surveys, usability, prototype and A/B tests, UX audits, competitor reviews, CJM, JTBD

Delivery: developer handoff, design QA of the built product, accessibility: contrast checks against WCAG AA

Domains: B2B platforms (HR, fintech, payments), e-commerce, crypto, iGaming and mobile games

Tools: Figma (variables, components, Auto Layout, prototypes), Photoshop, Illustrator, Notion; **AI:** Claude in Figma via MCP, Claude Code, Grok

Languages: English B2, German B1, Russian native

EDUCATION

IT HUB, a private college · 2022-2025

Vocational diploma, the program "Design (by industry)"

Preparing for a bachelor's in International Business Administration at WU Vienna, from 2028
